

Adobe FrameMaker 6.0 with MacOS 9.2.2

BEFORE YOU BEGIN: Make sure Acrobat Distiller is set up properly and that you've installed the required PPD and printer driver. You'll find instructions for doing this in "Acrobat Setup for OS 9.2.2."

STEP 1

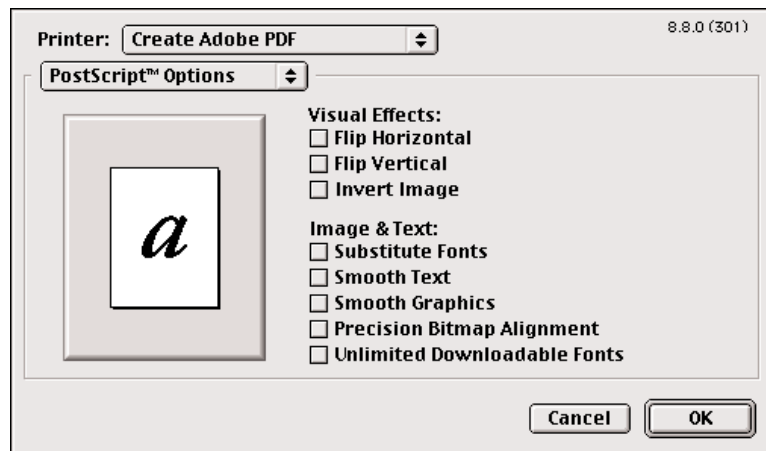

Open your document, choose File → Page Setup, and change your settings to match the illustration.

Use the Paper pop-up menu to set a custom page size with a width and height one inch greater than your document's width and height.

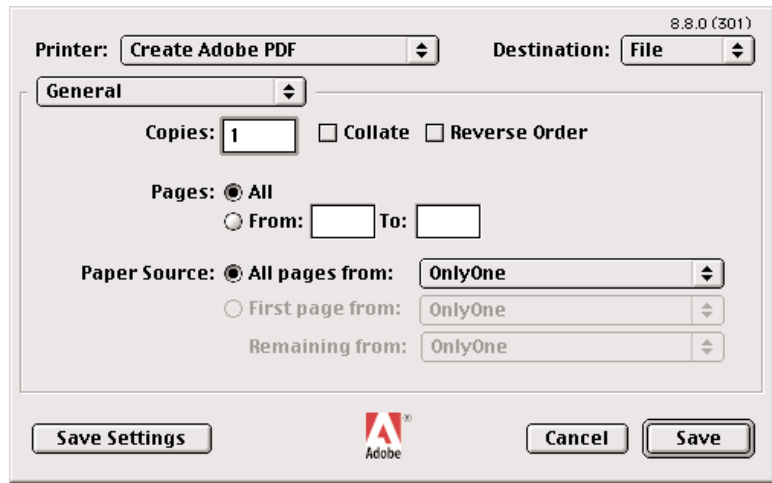

STEP 2

Choose PostScript Options from the pop-up menu and change your settings to match the illustration. Then click OK.

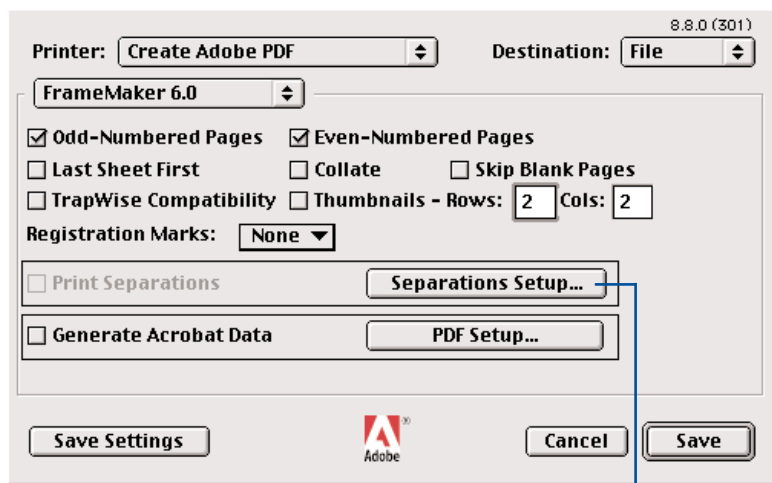

STEP 3

Choose File → Print, and change your settings to match the illustration.

STEP 4

Choose FrameMaker 6.0 from the pop-up menu and change your settings to match the illustration. Then click the Separations Setup button.

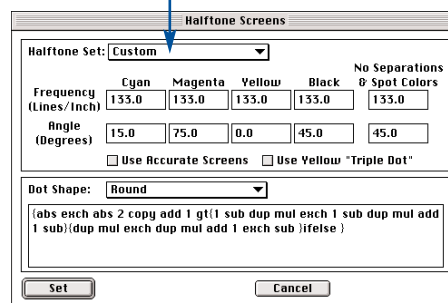

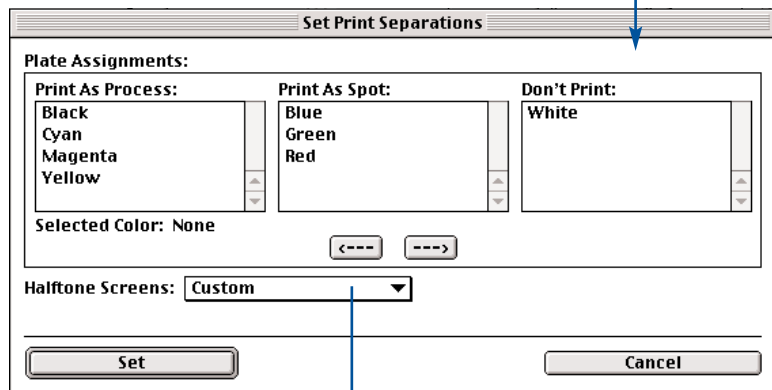

STEP 5

Select spot or process colors as appropriate and use the left and right arrow buttons to move them to the proper Plate Assignment column.

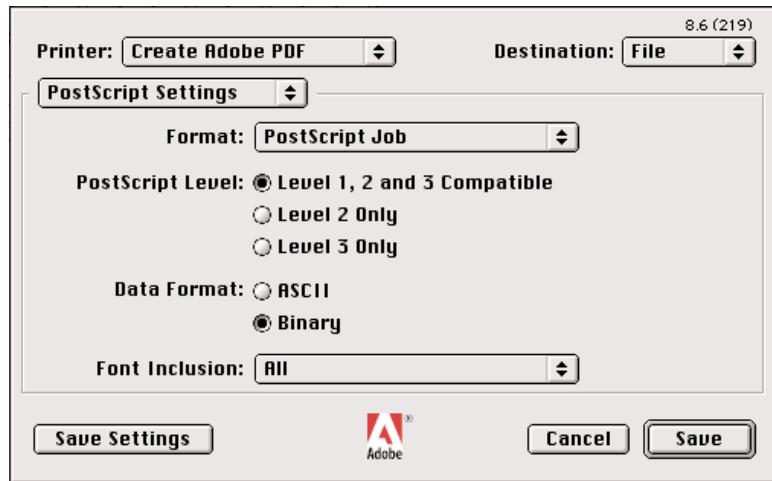

Next, select Custom from the Halftone Screens pop-up menu to activate the Halftone Screens dialog box, and change the settings to match the illustration.

Click the Set button, and then click the Set button again in the previous dialog box.

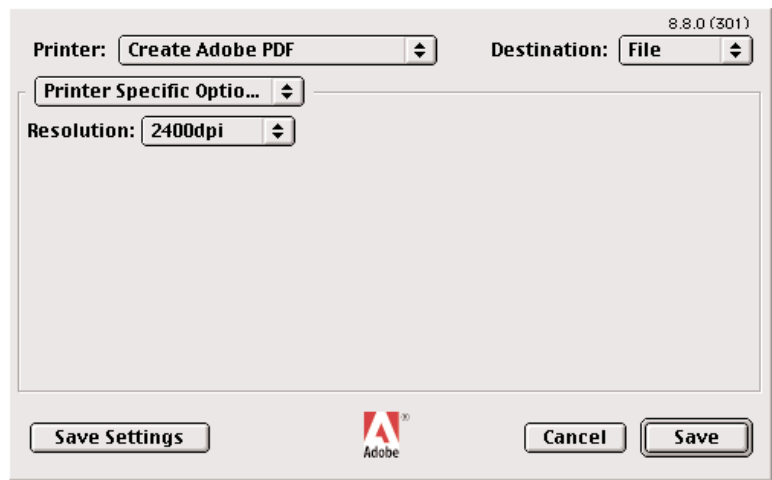

STEP 6

Choose PostScript Settings from the pop-up menu and change your settings to match the illustration.

STEP 7

Choose Printer Specific Options from the pop-up menu and change your settings to match the illustration.

STEP 8

Choose PDF Settings from the pop-up menu and change your settings to match the illustration. Then click Save.

When you click Save, a temporary PostScript file is created. Acrobat Distiller automatically launches and converts the PostScript file into a PDF file, and then quits. The PDF file is then opened in Acrobat.
